

WHAT IS CLAIMED IS:

1. An optical switch comprising:
  - a first multimode interferometer having a first input port to which an optical  
5 signal is applied, and at least two output ports;
    - a first optical waveguide connected to one or each of plural first output ports,  
which is or are selected from the output ports, and allowing a light exiting from the  
one or plural first output ports to propagate therethrough, the first optical  
waveguide having a refractive index changed in response to a trigger signal  
10 externally applied;
      - a second optical waveguide connected to one or each of plural second  
output ports, which is or are selected from the output ports, and allowing a light  
exiting from the one or plural second output ports to propagate therethrough; and  
trigger for supplying, to the first optical waveguide, the trigger signal for  
15 changing the refractive index of the first optical waveguide.
  2. An optical switch according to claim 1, wherein the first optical waveguide  
comprises a semiconductor optical amplifier.
  - 20 3. An optical switch according to claim 1, further comprising a second multimode  
interferometer having at least two input ports and a first output port, the input ports  
being connected respectively to an output end of said first optical waveguide and  
an output end of said second optical waveguide.
  - 25 4. An optical switch according to claim 3, wherein the second multimode  
interferometer changes intensity of an optical signal exiting from the first output

port of the second multimode interferometer, when the refractive index of the first optical waveguide is changed and phase of one of optical signals propagating through the first optical waveguide and the second optical waveguide is delayed from phase of the other optical signal.

5

5. An optical switch according to claim 3, wherein the second multimode interferometer has a second output port other than the first output port.

6. An optical switch according to claim 5, wherein the second multimode  
10 interferometer changes intensities of optical signals exiting from the first output port and the second output port of the second multimode interferometer, when the refractive index of the first optical waveguide is changed and phase of one of optical signals propagating through the first optical waveguide and the second optical waveguide is delayed from phase of the other optical signal.

15

7. An optical switch according to claim 3, wherein the second multimode interferometer has a shape line-symmetrical to the first multimode interferometer about an imaginary straight line connecting a middle point of the first optical waveguide and a middle point of the second optical waveguide.

20

8. An optical switch according to claim 1, wherein the trigger comprises:

a pair of reflecting mirrors arranged in an opposed relation with the first optical waveguide interposed therebetween so that a control light is multiple-reflected between the pair of reflecting mirrors; and

25

control light introducer for introducing the control light into a space defined by the pair of reflecting mirrors for multiple-reflection of the control light

therebetween.

9. An optical switch according to claim 1, wherein the first multimode interferometer has a second input port other than the first input port, and

5 wherein the trigger comprises:

a third multimode interferometer having a first input port to which a control light is applied, a first output port, and a second output port;

a third optical waveguide for introducing a light having exited from the second output port of the third multimode interferometer to the second input port of  
10 the first multimode interferometer; and

a combining optical element for combining a light having exited from the first output port of the third multimode interferometer with the optical signal, and introducing a combined light to the first input port of the first multimode interferometer.

15

10. An optical switch according to claim 9, wherein the combining optical element includes a fourth multimode interferometer having a first input port connected to the first output port of the third multimode interferometer and having a second input port to which the optical signal is applied, the combining optical element combining  
20 the light applied through the first input port with the optical signal applied through the second input port and then delivering a combined light from an output port thereof, the output port of the combining optical element being connected to the first input port of the first multimode interferometer.

25 11. An optical switch according to claim 9, wherein the second optical waveguide is a non-linear waveguide having a refractive index changed depending on

intensity of a light inputted to the second optical waveguide.

12. An optical switch according to claim 11, wherein the third multimode interferometer has a second input port other than the first input port, wherein when  
5 a control light is applied through the first input port of the third multimode interferometer, the control light is outputted from the first output port of the first multimode interferometer, and wherein when a control light is applied through the second input port of the third multimode interferometer, the control light is outputted from the second output port of the first multimode interferometer.

10

13. An optical switch according to claim 12, wherein the trigger further comprises a branching and delaying optical element for branching a control light applied through an input port thereof and introducing branched lights to the first input port and the second input port of the third multimode interferometer at different timings  
15 from each other.

14. An optical switch according to claim 13, wherein the branching and delaying optical element comprises:

a fifth multimode interferometer having an input port to which a control light  
20 is applied, and delivering a control light applied through the input port thereof from a first output port and a second output port thereof;

a fourth optical waveguide for connecting the first output port of the fifth multimode interferometer to the first input port of the third multimode interferometer; and

25 a fifth optical waveguide for connecting the second output port of the fifth multimode interferometer to the second input port of the third multimode

interferometer, the fifth optical waveguide having a different length from the fourth optical waveguide.

15. An optical demultiplexer comprising:

5 a plurality of drop devices, each of the drop devices having a control light input port to which a control light is applied, an optical signal input port to which an optical signal is applied, and a drop signal output port from which the optical signal is delivered in synchronous with inputting of the control light;

a signal waveguide for branching a time-division multiplexed optical signal  
10 and introducing a plurality of branched optical signals respectively to the optical signal input ports of the drop devices; and

a control waveguide for branching one control light and introducing a plurality of branched control lights to reach the corresponding drop devices at delays gradually shifted in units of a certain time.

15

16. An optical demultiplexer comprising:

a number  $N$  ( $N$  is two or larger integer) of drop devices, each of the drop devices having a control light input port to which a control light is applied, an optical signal input port to which an optical signal is applied, and a drop signal output port  
20 from which the optical signal is delivered in synchronous with inputting of the control light;

a signal waveguide for introducing an optical signal, which is time-division multiplexed at multiplicity of  $N$  and has a number  $N$  of channels, to the optical signal input port of each of the drop devices; and

25 a control waveguide for branching one control light into a number  $N$  of control lights and introducing an  $i$ -th ( $i$  is an integer not smaller than 1 but not larger

than N) one of the branched control lights to the control light input port of an i-th drop device,

the signal waveguide and the control waveguide delaying one of the control light and the optical signal relative to the other such that the control light applied to the i-th drop device is in synchronous with an i-th channel of the optical signal applied to the i-th drop device.

17. An optical demultiplexer comprising:

a number N (N is two or larger integer) of drop devices arranged from a first stage to an N-th stage, each of the drop devices having a control light input port to which a control light is applied, an optical signal input port to which an optical signal is applied, a drop signal output port from which the optical signal is delivered in synchronous with inputting of the control light, and a through signal output port from which the optical signal is delivered at least during a period in which the optical signal is not delivered from the drop signal output port;

a first signal waveguide for introducing a time-division multiplexed optical signal to the optical signal input port of the first-stage drop device;

a second signal waveguide for connecting the through signal output port of each drop device to the optical signal input port of the drop device in a next stage;

and

a control waveguide for branching one control light and introducing a plurality of branched control lights to reach the corresponding drop devices at delays gradually shifted in units of a certain time toward a most downstream stage.

18. An optical demultiplexer according to claim 17, wherein the optical signal is a signal having a number N of time-division multiplexed channels, and

wherein the control waveguide delays the control light inputted to an  $i$ -th ( $i$  is an integer not smaller than 1 but not larger than  $N$ ) drop device to be in synchronous with an  $i$ -th channel of the optical signal inputted to the  $i$ -th drop device.

5

19. An optical demultiplexer according to claim 15, wherein each of the drop devices is constituted by an optical switch, the optical switch comprising:

a first multimode interferometer having a first input port to which an optical signal is applied, and at least two output ports;

10 a first optical waveguide connected to one or each of plural first output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural first output ports to propagate therethrough, the first optical waveguide having a refractive index changed in response to a trigger signal externally applied;

15 a second optical waveguide connected to one or each of plural second output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural second output ports to propagate therethrough; and

trigger for supplying, to the first optical waveguide, the trigger signal for changing the refractive index of the first optical waveguide, and

20 wherein the first multimode interferometer has a second input port other than the first input port, and

wherein the trigger comprises:

a third multimode interferometer having a first input port to which a control light is applied, a first output port, and a second output port;

25 a third optical waveguide for introducing a light having exited from the second output port of the third multimode interferometer to the second input port of

the first multimode interferometer; and

a combining optical element for combining a light having exited from the first output port of the third multimode interferometer with the optical signal, and introducing a combined light to the first input port of the first multimode

5 interferometer.

20. An optical demultiplexer according to claim 16, wherein each of the drop devices is constituted by an optical switch, the optical switch comprising:

a first multimode interferometer having a first input port to which an optical  
10 signal is applied, and at least two output ports;

a first optical waveguide connected to one or each of plural first output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural first output ports to propagate therethrough, the first optical waveguide having a refractive index changed in response to a trigger signal  
15 externally applied;

a second optical waveguide connected to one or each of plural second output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural second output ports to propagate therethrough; and

trigger for supplying, to the first optical waveguide, the trigger signal for  
20 changing the refractive index of the first optical waveguide, and

wherein the first multimode interferometer has a second input port other than the first input port, and

wherein the trigger comprises:

a third multimode interferometer having a first input port to which a control  
25 light is applied, a first output port, and a second output port;

a third optical waveguide for introducing a light having exited from the

second output port of the third multimode interferometer to the second input port of the first multimode interferometer; and

a combining optical element for combining a light having exited from the first output port of the third multimode interferometer with the optical signal, and

5 introducing a combined light to the first input port of the first multimode interferometer.

21. An optical demultiplexer according to claim 17, wherein each of the drop devices is constituted by an optical switch, the optical switch comprising:

10 a first multimode interferometer having a first input port to which an optical signal is applied, and at least two output ports;

a first optical waveguide connected to one or each of plural first output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural first output ports to propagate therethrough, the first optical

15 waveguide having a refractive index changed in response to a trigger signal externally applied;

a second optical waveguide connected to one or each of plural second output ports, which is or are selected from the output ports, and allowing a light exiting from the one or plural second output ports to propagate therethrough; and

20 trigger for supplying, to the first optical waveguide, the trigger signal for changing the refractive index of the first optical waveguide, and

wherein the first multimode interferometer has a second input port other than the first input port, and

wherein the trigger comprises:

25 a third multimode interferometer having a first input port to which a control light is applied, a first output port, and a second output port;

a third optical waveguide for introducing a light having exited from the second output port of the third multimode interferometer to the second input port of the first multimode interferometer; and

a combining optical element for combining a light having exited from the first  
5 output port of the third multimode interferometer with the optical signal, and  
introducing a combined light to the first input port of the first multimode  
interferometer.

22. An optical demultiplexer according to claim 15, further comprising a transducer  
10 for converting the optical signal delivered from the drop signal output port of each  
of said drop devices into an electrical signal.

23. An optical demultiplexer according to claim 16, further comprising a transducer  
for converting the optical signal delivered from the drop signal output port of each  
15 of said drop devices into an electrical signal.

24. An optical demultiplexer according to Claim 17, further comprising a  
transducer for converting the optical signal delivered from the drop signal output  
port of each of said drop devices into an electrical signal.

20
